

Sterile Water

What are they used for?

Sterile water is used to dissolve drugs and flush syringes.

Practice:

These 3ml sterile water packages are made for one-time use.

How they are used:

Place drugs and sterile water into a cooker and throw away water you don't use.

Risks:

Always make sure that your 3ml Sterile Water package is not leaking before you use it. If it is leaking, the water is no longer sterile. Throw it out and get a new one.
